Weather Modification Programs

It is clear to anyone watching the sky that there are major differences between the condensation trails left by average jet aircraft traffic and the “Chemtrails” that are applied almost daily in patchwork fashion across most of the United States. I have reviewed video coverage of the patterns dated from 2000 and earlier, and became really aware of the process myself in 2001 with a video supplied by Rosalind Peterson who contacted me because I had been raising concerns about the changing vegetation patterns and unnatural sky formations.

I was a Meteorological Technician in The United States Air Force from 1960-1964 and a trained weather observer. I have been a wildlife biologist and general ecologist with the State Department of Fish and Game for more than 35 years and have witnessed a slow but ever changing condition in our native plant communities. While the cloud formations were not really normal, they did not catch my attention right away since the changes were slow and I was looking at other things.

In 2000 I witnessed a major die-off of chaparral (shrub communities) in Lake County that was noticed by ranchers and other publics who made inquiries and stated they had never seen anything like it ... nor had I. Samples taken of a wide variety of species indicated dead branch tips and it was clear that the effects were spread across a wide variety of species and it was not a simple case of insect damage as later reported to me by State pathologists. Keep in mind that there was an ever-increasing infestation of molds, mildews and fungus in the Coast Range and “Sudden Oak Death” or SOD was rapidly spreading from the south to the north. At the time, SOD was prevalent in Marin, Sonoma, and Napa Counties but had not been identified in Lake County.

The samples I collected were determined not to have SOD, however the answer did not account for the fact that the symptoms of dead tree tips and other vegetative die-off were almost identical to the problems in those areas. If it is not SOD, then what is going on? The plants were obviously stressed, and it was wide spread in both area and species. This seemed to indicate that the problem was much larger than SOD, and it was not just the result of insect damage. Most bark beetles and forest insect damage occurs when plants are stressed and exude infrared light, which attract the insects that are equipped with infrared sensors. They generally do not attack healthy trees, and it exceedingly uncommon to have so many plant species involved.

As I watched the daily chemtrail patterns, I witnessed that they come in many colors from the standard white, to yellow and black. I also watched the aircraft turn them on and off ... something you cannot do with contrails. To form clouds, chemicals such as silver iodide are vented or sprayed, and this fine particulate matter acts as a nucleus to attract water vapor and form the cloud. Such cloud formation removes moisture from the air and accelerates evaporation, thus removing water from the ground and plants. The

clouds then travel toward the mountains where they tend to drop water. This process is moving water in an unnatural way, and in effect is increasing evaporation and stressing leaf and branch tips, and opening the plants to disease and insect infestation.

I have been watching this process now for many years, and have become convinced that the broad stress patterns observed on the plants is caused by the changes in the weather patterns to both moisture and solar illumination. These changes are resulting in more chaotic patterns with broad swings in water availability and light for plant growth, with varying annual effects across the landscape in mosaics ... with poor to no grass growth in many areas and excellent growth in others, but none under natural conditions. One year there is major tip death, and the next there is strong growth, all of which confuses the average observer, as things seem more normal.

As I have traveled, I have witnessed spraying in Arkansas and Illinois and across the US, and it is clear to me the program is enormous. It is also clear to me that the program is altering the natural environment in ways that could threaten our entire ecosystem and natural plant and animal communities. The chaos could be responsible for the forest die-offs and beetle infestations, as well as the resulting firestorms through many forest systems. I believe it is the mechanism responsible for the spread of SOD and other pathogens in both natural and agricultural systems, and that the focused studies on particular pathogens is missing seeing the “forest from the trees.” It may also be responsible for changes in storm intensity and damage as it changes planetary patterns.

As a note, I have seen from 4 to 6 aircraft working an area at a time. To fund such a program across California, or across the US with literally hundreds of planes, thousands of personnel and tons of chemicals would be beyond the capacity of private enterprise just for water recovery systems (main excuse for cloud seeding) and must cost millions to billions of dollars. This could only be covered under the pretext of Defense and covert government programs. While I have heard many conspiracy theories, I for one would like to hear an explanation for the global weather modification program and the reasons for putting our planet and its ecosystem, as well as human life at risk.
